EXPERIENCE

Undergraduate Research Assistant | VIA Lab @ UC Davis — Davis, CA

Jun 2026 – Present

- Collaborated with PhD researchers to **build reproducible datasets** and **evaluation pipelines** supporting ongoing **computer vision and AI research**.
- **Conducted literature reviews** and summarized experimental findings to support manuscript preparation and ongoing research.

AI Intern | Helix International — Grand Rapids, MI

Jun 2025 – Sep 2025

- **Benchmarked 5+ open-source** and hosted LLMs (**Ollama, Meta, Microsoft Phi, Hugging Face**) against 70+ custom test questions, **deploying vLLM locally** and on a GPU desktop to select the best-performing model for offline inference.
- **Load-tested model** inference endpoints with Locust, simulating concurrent user traffic to measure success/failure rates and identify which models were production-ready.
- Designed **FastAPI backend** services integrating LangGraph orchestration, SQL generation, retrieval pipelines, and LLM inference for enterprise knowledge search.
- Cut LLM hallucination to **under 10% (90%+ accuracy)** on **GPT-oss and Qwen3** by tuning sampling temperature and narrowing retrieved context through post-processing, then documenting the approach for team reuse.

CS Tutoring | UC Davis — Davis, CA

Jan 2025 – Jun 2025

- **Tutored computer science students 1:1** on coursework, projects, and assignments, translating abstract debugging steps into clear, teachable explanations.
- Helped students **diagnose** and **fix logic and implementation bugs** across multiple languages, reinforcing core data structures & algorithms fundamentals

PROJECTS

JourZy — AI Travel Companion

Feb 2026 – Present

- Built a **React chat UI** and **Node.js backend** for an AI travel-planning assistant that plans flights, hotels, transportation, and daily attractions for travelers unfamiliar with booking apps.
- Called the **Google Maps, Distance Matrix, and OpenWeather APIs** to surface live transportation routing and a 7-day weather forecast with packing suggestions.
- Designed and implemented **RESTful** backend services coordinating multiple **AI models, PostgreSQL, and third-party APIs** to generate personalized travel itineraries.
- **Deployed on Vercel** and shipped solo end to end, iterating on feedback from **5+ real users** into a prioritized feature backlog.

AI Log Observability Platform

Jun 2025 – Present

- Built an AI-powered observability platform that aggregates streaming application logs, surfaces root-cause analyses using **LLM embeddings**, and **visualizes system health metrics** through real-time dashboards.
- **Built backend ingestion pipelines** for streaming logs using **time-series aggregation**, enabling **real-time monitoring** and interactive dashboards.

TECHNICAL SKILLS

Languages: Python, Java, C++, SQL, HTML/CSS, JavaScript

Frontend: React, Tailwind CSS, Recharts, D3.js

Backend: Node.js, Express, FastAPI, REST APIs

Databases: PostgreSQL, Supabase, schema design

AI / ML: LLMs, RAG, LangGraph, vLLM, Ollama, PyTorch, TensorFlow, OpenAI API, Gemini API

Tools: Git, GitHub, Vercel, Render, OpenRouter, Docker

Eligible to work with OPT - STEM

EDUCATION

University of California, Davis | B.S. Computer Science

Graduated in June 2026

Relevant Coursework: Data Structures & Algorithms, Algorithm Design & Analysis, Operating Systems, Machine Learning, Computer Architecture
